(Note) Silk screen print in the above picture is a composite. The actual print may differ.

- Introduction

First of all, thank you for having purchased our LCD controller IC (KS-LTWV-SD (LVDS)) and the touch panel controller IC (KS-R8TPC or KS-R10TPC) (the "Product"). This hardware manual (the "Manual") provides an overview of the Product. We hope that you will read the Manual carefully and make use of it for efficient development.

- Important Information

1. The Product and this Manual may change without notice. Before using the Product, obtain the newest catalog, manual, etc., from the company website.
2. The Product is not designed to be used in systems or devices that can cause death, injury, or serious physical or environmental damage directly due to any malfunction of the Product (life support device, nuclear facility equipment, aircraft, traffic control equipment, various safety devices, etc.). Danger and damage due to the Product being used in the foregoing systems or devices are the sole responsibility of the customer.
3. We assume no responsibility for any damages due to the use or the operation of the Product in a misguided or wrongful way.
4. The usage examples outlined herein are only an explanation of the Product functions. We assume no responsibility for any complaints, accidents, or any disadvantages which may be caused by the use on the basis of the examples outlined in this Manual.

## 1. Composition of the LCD Controller IC and the Touch Panel Controller LCD

1) KS-LTWV-SD (LVDS) (LCD controller IC)

KS-LTWV-SD (LVDS) is broadly applicable to the LVDS LCD, including WVGA TFT LCD "GVTW70SPAH series" (manufacturer: SGD), etc.
2) KS-R8TPC or KS-R10TPC (Touch panel controller)

KS-R8TPC is a CPU device with 2 channels, 8 -bit A/D conversion (manufacturer: Renesas, model: R5F211B4SP).

KS-R10TPC is a CPU device with 2 channels, 10-bit A/D conversion (manufacturer: Renesas, model: R5F211B4SP).
(Manufacturer of the CPU and product number may change without notice.)

LCD display and touch panel control become possible by using the above set of two. Additionally, display is also possible using only the LCD controller IC.

## 2. Overview and Features of the Product

KS-LTWV-SD (LVDS) is an LCD controller developed for embedded systems, with the following characteristics.

1) This LCD controller is WVGA TFT color LCD-compatible (Interface is LVDS). The LCD controller is equipped with a built-in LVDS interface. We guarantee that signal distance for the LVDS is 2 m .
2) The frame buffer memory is SDR SDRAM-compatible. When using the SDR SDRAM ( $2 \mathrm{M} \times 16$-bits $\times 4$ banks), you can select a wide area of $2,048 \times 1,024$ pixels $\times 4$ pages to $800 \times 480$ pixels.
3) Color can be displayed in 2 modes: 64 colors in 4,096 color mode (palette format) $\times 2$ pages and 65,536 color mode $\times 1$ page.
4) By making the screen one page per area, 65,536 colors can be displayed. (There are function restrictions such as blinking, etc.).
5) Two-layer superimposed display is possible. (Only the 64 colors in 4,096 color mode).
6) When a flash-ROM is installed to the CPU bus, short videos can be played.
7) The Tiny-accelerator function allows high-speed drawing of lines and fill-ins of
rectangular shapes.
8) There is an automatic switch display function per pixel, which decreases the load on the CPU.
9) Design is easy with only knowledge of the Host-CPU. LCD expertise is not necessary
10) The Host-CPU is most compatible with the H8 Host-CPU (Hitachi) and SH Host-CPU. (Interface with 3.3V Host-CPU is possible.)
11) Connection with a touch panel controller in which the touch panel data is 10 -bit (KS-R10TPC) is possible.
12) When writing the image data from the flash memory to the frame buffer memory (SDRAM), it is possible to not write the color specified by the register.
13) The SDRAM can be switched to a self-refresh state.

## 3. System Configuration Diagram

The outline framework for KS-LTWV-SD (LVDS) is as follows. The customer only needs to prepare a SDR SDRAM in order to complete the LCD controller. And, by preparing a large flash memory, the LCD controller reads data automatically, image display is also possible.

Note 1. The blue areas indicate the LCD controller and the touch panel controller.
Note 2. When the touch panel (KS-R8TPC or KS-R10TPC) is not necessary, its circuit part is deletable.

## 4. Pins

## Diagram) Pinout Diagram

The following table indicates pin assignments (list of pin numbers and signal names) for KS-LTWV-SD (LVDS).

In this Manual, we have provided the reference circuits as examples. (However, operation of these circuits is not guaranteed. Be aware that the circuit may not operate due to certain circumstances and conditions.)

Table 1) KS-LTWV-SD (LVDS)

| Pin No | Pin Name | Interface | Pin No | Pin Name | Interface |

- Image data transfer not occurring (Normal state)

A21~A0 •• Input
FROMCS\# • . • Hi impedance
RD\# ••• Input

## 【Reference Circuits】

(1) Reference Circuit Diagram of the LCD Controller IC Area

(Connection and Precautions)

- Quartz Module

Although the quartz module contains the SG8002 (EPSON); any product with a frequency of 38.362 MHz can be used.

There are two clock pins (No. 97 pin and No. 208 pin) for the LCD controller. Provide each clock from same quartz module.

- About the CPU Bus

Connect to Hitachi-manufactured H8 Host-CPU, SH-2 Host-CPU, or SH-3, 4 processor, etc.

For the address bus, connect the A22~A1 from the CPU to the A21~A0 pins of the LCD controller.
When using the H8 Host-CPU, SH-2 Host-CPU, or $\mathrm{SH}-3$ processor, connect the WAIT\# signal from the LCD controller to the WAIT\# pin input of the CPU. Always pull up with a resistance of $4.7 \mathrm{k} \sim 10 \mathrm{k}$ for the WAIT\# signal. When using the SH-4 processor, connect the READY\# signal from the LCD controller to the RDY\# pin input of the CPU.

When installing the FROM for images and using the image data transfer function of the LCD controller, the LCD controller accesses the FROM for images, so it is necessary to release the CPU bus. In that case, connect the BREQ\# signal and BACK\# signal of the LCD controller to the BREQ\# pin and BACK\# pin of the CPU.

When transferring image data, I/O direction is switched for some signals of the CPU bus. Regarding the switch timing of the I/O direction, refer to " 5 . Electrical Characteristics (DC, AC), Access Timing Specifications".

- Reset Signal

The LCD controller provides RESET\# input pins for the LCD controller. The internal circuit is reset by ACTIVE LOW. Connect the reset signal used by the CPU, etc. Additionally, if there is noise on the reset signal line, mount a capacitor with the capacity of about 104 near the RESET\# input pin, in order to prevent inadvertent resets.

- Connection to the SDR SDRAM

Refer to "(2) Reference Circuit of the SDR SDRAM" below.

- Connection to the FROM for image

Refer to "(3) Reference Circuit of the FROM for images" below.

- Connection to the LCD

Refer to "(4) Reference Circuit of the LCD I/F" below.

- Connection to the LED Backlight Circuit

Refer to "(5) Reference Circuit for Backlight I/F" below.

- Connection to the Touch Panel Controller (KS-R8TPC or KS-R10TPC)

KS-R8TPC or KS-R10TPC can be connected directly. For more details, refer to "Touch panel controller IC KS-R8TPC hardware manual" or "Touch panel controller IC KS-R10TPC hardware manual".
When using the LCD controller only, use the control signals (PCLK, PDATA, TPV) with the open state.

- Arrangement of the Bypass Capacitor

Be particularly careful about the arrangement of the bypass capacitor. When a four- layer board is impossible, bring as close to the LSI VCC pin as possible.

- Power Supply for PLL

PLL is used inside the LCD controller. As the LRC_VCCPLL and ULC_VCCPLL power supply pins for the PLL are susceptible to noise, make a single point connection (connect via a $0 \Omega$ resistor) with other power supplies as shown in the diagram below.
Moreover, in order to further eliminate the effect of noise, it is recommended to insulate from other power supplies using an inductor. (Replace $0 \Omega$ resistor with inductor.)

Inductor Specifications (Examples)
■ Package size 0805 package $(2 \times 1.25)$

- Rated current 1A

■ Inductance $1 \mu \mathrm{H}$ and over

(2) Reference Circuit of the SDR SDRAM (IS42S16800E-7TL)

Be careful with the connection of the bypass capacitor; place near the VCC. Additionally, for the pattern length, make sure the distance from the LCD controller is under 10 cm . It is recommended that the wiring use the fewest number of vias as possible, and that isometric wiring is used.
Use the SDR SDRAM with 7 nS and under (IS42S16800E-7TL (ISSI), IS42S16800E-6TLI, etc.).
(3) Reference Circuit of FROM for images (S29GL512P10TFI)

The above diagram is the connection example to the flash memory "S29GL512P10TFI" (SPANSION).

## (4) Reference Circuit of the LCD I/F

- Connection example to WVGA-TFT LCD (SGD)

The above diagram is the reference circuit diagram when connecting the WVGA-TFT LCD "GVTW70SPAH series" ( 7 inch ).

## - About the LVDS Pattern

For the LVDS pattern wiring, be careful of the following points as much as possible.

- The wiring should use the fewest number of vias between the LCD controller and connector.
- When setting a via on one side of a differential pairing, also set a via on the other signal line, making the same state.
- Use isometric wiring between the LCD controller and connector.
- The distance between the LCD controller and connector should be as short as possible.
- Do not place a divided slit in the internal layer GND pattern of the LVDS signal.
- The wiring interval A between differential pairs should be at a minimum.
- The wiring interval between each pair should be $\mathrm{A} \times 2$ or more.
- The LVDS and CMOS or TTL wiring interval should be $\mathrm{A} \times 3$ or more.

- Signal mapping of the LVDS

The following diagram is a signal map of the LVDS signal output data.

## (5) Reference Circuit for Backlight I/F (reference)

- Reference circuit for LED backlight(Kenic System: KSLBC-4(D3))

The above diagram is an example connection between the LED backlight power supply "KSLBC-4 (D3)" (Kenic system) (sold separately) and the LCD controller.

This LED backlight power supply can be used for the following LCDs: WVGA-TFT LCD "GVTW70SPAH series" ( 7 inch ) (manufacturer: SGD).

When the EN signal is open, the backlight is in the ON state. By connecting the BLEN signal outputted from the LCD controller to the open collector or digital transducer, ON/OFF for the backlight can be controlled.
Brightness of the backlight can be controlled by the PWM signal. The PWM frequency and ON width can be set by the register. For the setting method, refer to "11. About the registers". And, for the PWM input specification for the LED backlight power supply, refer to the LED backlight power supply specifications.
There are also LED backlight power supplys which are compatible with other LCDs. For more details, please make an inquiry to our sales staff.

## 5. Electrical Characteristics (DC, AC), Access Timing Specifications

- Maximum Ratings

| Item | Sign | Rating | Units |
| :--- | :--- | :--- | :--- |
| Power supply <br> voltage | VCC | $-0.5 \sim 1.32$ | V |
| Power supply <br> voltage | VCC <br> AUX | $-0.5 \sim 3.75$ | V |
| Power supply <br> voltage | VCC <br> J | $-0.5 \sim 3.75$ | V |

| VCCIO3 | 2.5 | 0.0307 | 0.0307 | 0.07675 | 0.07675 |
| VCCJ | 3.3 | 0.0011 | 0.0011 | 0.0037 | 0.0037 |

1. For the power supply "VCCAUX", a peak of 0.085 A may flow at start-up.

- Refresh Rate

| Item | Sign | Standard | Units |
| :---: | :---: | :---: | :---: |
| Refresh rate |  | 71 | Hz |

2) Write Cycle for the LCD Controller Host-CPU Interface

| Sign | Item | Min. | Max. | Unit |
| :--- | :--- | :---: | :---: | :--- |
| TSA | Address setup | 10 | - | ns |
| THA | Address hold | 12 | - | ns |
| TSD | Data setup | 5 | - | ns |
| THD | Data hold | 12 | - | ns |
| TWAD | WAIT output delay | - | 17 | ns |
| *1 | WAIT\# (READY\#) <br> width | - | 11000 | ns |

WAIT\# and READY\# signals are outputted under either of the following conditions.

- When the time between the previous write signal rises and the next signal falls is 50 ns or less. (In the case of writing to the Color Palette Register and frame buffer memory.)
- For this LCD controller, write data from the CPU to the frame buffer memory is written to the internal buffer (FIFO). The data written to the FIFO is read from the internal buffer when not reading display data from the frame buffer memory, and is written to the frame buffer.
The internal buffer has room for 1,024 pixels worth of data, but when the write data stored in the internal buffer exceeds the near-full state (data for 1,016 pixels), WAIT\# (READY\#) is outputted. At this time, when the write speed far exceeds the processing capacity of the LCD controller, the WAIT\# (READY\#) width becomes longer. However, the maximum values in the above table are only a worst case scenario; in fact, the possibility of it becoming this long is low.

3) Read Cycle for the LCD Controller Host-CPU Interface

| Sign | Item | Min. | Max. | Unit |
| :--- | :--- | :---: | :---: | :--- |
| TAA | Address access <br> time | - | 20 | ns |
| TOHA | Output hold time | 0 | - | ns |
| TACS | Chip select access time | - | 15 | ns |
| TDRD | Read access time | - | 15 | ns |
| THZRD | Read disable output <br> High-Z time | - | 15 | ns |
| TLZRD | Read enable output set <br> time | 0 | - | ns |
| THZCS | Chip select disable <br> output High-Z time | - | 15 | ns |
| TLZCS | Chip select enable <br> output set time | 0 | - | ns |

Caution) The LCD controller can be read only some registers, not be read the frame buffer memory.
4) CPU bus Switching timing of I/O direction

- Image data transfer start time

- Image data transfer finish time

## 6. Address Map

6-1 Address Map for the frame buffer memory

Diagram 6-1 Address Map for the frame buffer memory

The LCD controller is compatible with an SDR SDRAM of $4,096 * 512$ words $* 4$ banks. As in Diagram 6-1, the frame buffer memory is divided into four areas, with a screen resolution of 2,048 pixels (horizontal), 1,024 pixels (vertical) per area. With display and write area specified registers, the area that is displayed to the LCD and the area where the drawing data is written to can be selected.
In the 64/4,096 color mode, the frame buffer has room for 2 pages per area.

With this, two-layer superimposed display (transparent display) within the same area is possible. In the 65,536 color mode, it becomes 1 page per area.
In addition, with the Display-start X-coordinate-setting Register and the Display-start Y-coordinate-setting Register, an image of $800 * 600$ (SVGA) can be displayed from an arbitrary position in the area as shown in Diagram 6-2.

Diagram 6-2 Display Area

6-2 Address Map for the LCD controller
【KS-LTWV-SD (LVDS)】

| 000000H | Frame Buffer <br> Area 1 (Area 2, 3, 4) : PAGE0 (PAGE1) |
| :---: | :---: |
| 3FFFFFH |  |
| $400000 \mathrm{H}$ | Free |
| 7FFF00H | Color Map Table |
| 7FFF7FH <br> 7FFFC0H <br> 7FFFFFH | Various Register |

The above is the address map for the LCD controller as viewed from the CPU. In 64 colors in 4,096 color mode, the frame buffer has 4 areas for 2 pages (PAGE0 and PAGE1). And, in 65,536 color mode, it has 4 areas.
The bank switching method is used to switch pages, and this is accomplished by setting control register 2 (DCR2). And, the area switching is accomplished by setting the register for display area and write area. Therefore, the address range of the frame buffer as viewed from the CPU is for one area.

## 7. Pixel Composition of the Screen

## (1) 64 Colors in 4,096 Color Mode

In the 64 colors in 4,096 color mode, word access and/or byte access is possible.
For word access, set valid data in the lower byte of the 2 bytes from the address in the following diagram, and access the LCD controller. The data for the higher byte is ignored in the LCD controller.
Additionally, when conducting byte access, add one ( +1 ) to the address in the following diagram, and access the LCD controller with an odd-numbered address.

```
(0,0)=0000H, (1,0)=0002H \ldots. ... (2047,0)=0FFEH
(0,1)=1000H, (1,1)=1002H ... ... (2047,1)=1FFEH
(0,2)=2000H, (1,2)=2002H \ldots. ... (2047,2)=2FFEH
(0,1023)=3FF000H, (1,1023)=3FF002H ... ... (2047,1023)=3FFFFEH
```

Each pixel corresponds completely to each bit.
For this LCD controller, the frame buffer exists from ( 0,0 ) to (2,047, $1,023)$ per area. However, the displayable area range is $800 * 480$ beginning at the display start coordinate (coordinates set in the Display-start X-coordinate-setting Register and the Display-start Y-coordinate-setting Register.).
(2) 65,536 color mode

```
(0,0)=0000H, (1,0)=0002H ... ... (2047,0)=0FFEH
(0,1)=1000H, (1,1)=1002H ... ... (2047,1)=1FFEH
(0,2)=2000H, (1,2)=2002H ... ... (2047,2)=2FFEH
(0,1023)=3FF000H, (1,1023)=3FF002H ... ... (2047,1023)=3FFFFEH
```

Each pixel corresponds completely to each bit.

For this LCD controller, the frame buffer exists from $(0,0)$ to $(2,047$, 1,023 ) per area. However, the displayable area range is $800 * 480$ beginning at the display start coordinate (coordinates set in the Display-start X-coordinate-setting Register and the Display-start Y-coordinate-setting Register.).

## 8. Displayed Data

This LCD controller uses the color palette format. Firstly, the following is an explanation of this color palette format.
【About the color palette】
When displaying color, usually the color code is designated; for example, there are times when this color code is fixed, such as 02 H for blue, 0 CH for green, however, another method is when the value of 02 H is not fixed to a color such as red but instead indicates that a value representing a color is being stored at that location. With this way, programmers can code more abstract software.
As such, the register housing the list of color addresses and the colors themselves is called the "color palette table."
For example, let's suppose the command "draw a BOX from $(100,100)$ to (200, 200) using color $03 \mathrm{H}^{\prime}$ is written in the C language. The color indicated by 03 H is at first aqua, but let's also say that afterwards we want to change the color to light green. In this case, we only have to change the color registered to 03 H in the color palette, and the areas drawn using 03 H will all change automatically. Even when the LCD can display only 64 colors, it is possible to select from 4,096 colors, allowing for a remarkably better visual quality.

## (1) 64 Colors in 4,096 Color Mode

The displayed data to be written in each frame buffer need to have a set color palette code.
The access to the frame buffer is possible for both word access and byte access.
When writing data in word access, specify an even־numbered address for access. At this time, the data for the lower byte is valid.
When writing data in byte access, specify an odd-numbered address and access only the lower address.

Image Memory Area
000000H~3FFFFEH (Higher bytes D15~8)

For the method to house color data for each color palette, refer to the "12. About the Registers" chapter.
(2) 65,536 color mode

With the 65,536 color mode for DCR1, write 16 -bit (RGB) data to the frame buffer memory in the following format.
Execute access to the frame buffer using only word access.

Per-byte access is not supported.

## Image Memory Area

## 9. Drawing Function

This LCD controller includes the following drawing functions.
(1) Line Drawing Function
(2) Arbitrary Rectangle Fill-in Function

## 9-1 Line Drawing Function

By using this function, arbitrary lines (vertical, horizontal, and diagonal) can be drawn at high-speed.
When drawing a line as in Diagram 9-1, after setting the starting point coordinates (X1, Y1), the ending point coordinates (X2, Y2), and the color to the register (Regarding registers, refer to "11. About the Registers".), the line drawing function is performed in the Line-drawing Start-setting Register.
As the size comparison of the starting and ending point coordinates is executed inside the LCD controller, for the Host-CPU side software, register settings can be conducted without worrying about the size comparison. Also, the coordinate register is 2 bytes. When setting a value larger than the area size ( $2,048 \times 1,024$ pixels), beware that the display can become strange.
During the line drawing process, avoid accessing the frame buffer memory from the CPU, performing other drawing functions (Hard Fill, Arbitrary Rectangle Fill-in Function, Image Data Transfer Function), or line drawing. During the line drawing process, place a BUSY flag of the Hard Fill Status Register. Check for this flag and confirm that the operation has completed before accessing the frame buffer memory or executing the next drawing function. Additionally, at the completion of the operation, a one-shot signal of the ACTIVE LOW is outputted from the INTOUT signal of the LCD controller (The pulse width is about $1 \mu \mathrm{SEC}$.). By connecting this signal to the IRQ port of the CPU, the CPU can detect the completion of the operation by interruption.
In the 64/4,096 color mode, the drawing is performed in the display area and write area specified in the write area-specified register, and in a page specified for the DCR2 register.

In the 65,536 color mode, the data is written to the displayed area and the write area specified in the write area-specified register.

Diagram 9-1 About Line Drawing

## 9-2 Arbitrary Rectangle Fill-in Function

By using this function, arbitrary rectangle fill-in can be drawn at high-speed.
When drawing a rectangle fill-in as in Diagram 9-2, after setting the starting point coordinates ( $\mathrm{X} 1, \mathrm{Y} 1$ ), the ending point coordinates ( $\mathrm{X} 2, \mathrm{Y} 2$ ), and the color to the register (Regarding registers, refer to " 12 . About the Registers".), the rectangle fill-in function is performed in the Rectangle Fill-in Start Register.
As the size comparison of the starting and ending point coordinates is executed inside the LCD controller, for the Host-CPU side software, register settings can be conducted without worrying about the size comparison. Also, the coordinate register is 2 bytes. When setting a value larger than the area size ( $2,048 \times 1,024$ pixels), beware that the display can become strange, it will take time before the drawing completes.

During the rectangle fill-in process, avoid accessing the frame buffer memory from the CPU, performing other drawing functions (Hard Fill, Line Drawing Function, Image Data Transfer Function), or rectangle fill-in. During the rectangle fill-in process, place a BUSY flag of the Hard Fill Status Register. Check for this flag and confirm that the operation has completed before accessing the frame buffer memory or executing the next drawing function. Additionally, at the completion of the operation, a one-shot signal of the ACTIVE LOW is outputted from the INTOUT signal of the LCD controller (The pulse width is about $1 \mu \mathrm{SEC}$.). By connecting this signal to the IRQ port of the CPU, the CPU can detect the completion of the operation by interruption.

Diagram 9-2 About Rectangle Fill-in

In the 64/4,096 color mode, the drawing is performed in the display area and write area specified in the write area-specified register, and in a page specified for the DCR2 register.
In the 65,536 color mode, the data is written to the displayed area and the write area specified in the write area-specified register.

## 10. Image Data Transfer Function

The "Image Data Transfer Function" is a function that reads arbitrary image data from the FROM for images connected to the CPU, writes to the frame buffer, and displays an image on arbitrary coordinates. The LCD controller outputs the bus release signal to the CPU in order to read the data from the FROM for images connected to the CPU, and then checks the release of the bus before reading image data from the FROM for images. Therefore, the CPU is unable to access the external bus during this time.
Only necessary information has to be set in the following registers for the LCD controller to transfer image data automatically (Regarding registers, refer to "12. About the Registers.").

- Image-display Start-position X-coordinate-setting Register
- Image-display Start-position Y-coordinate-setting Register
- Leading-address-setting Register for the Image Data Storage Location
- Image-data Display-size Width-setting Register
- Image-data Display-size Line-number-setting Register
- Image Control Register

For example, when displaying image data stored in the FROM for images to the display coordinates (X1, Y1) as shown in Diagram 10-1, set the leading address where the image data is stored in the Leading-address-setting Register for the Image Data Storage Location, and set the display coordinates (X1, Y1) in the Image-display Start-position X-coordinate-setting Register and the Image-display Start-position Y-coordinate-setting Register. Next, set the display size of the image data (width, line number) in the Image-data Display-size Width-setting Register and the Image-data Display-size Line-number-setting Register. When executing the transfer in the Image Control Register, the LCD controller transfers the image data automatically, and the display is performed. While transferring image data, the CPU is unable to use the external bus.
After completing the transfer, the LCD controller stops the bus open
command to the CPU, and a one-shot signal of the ACTIVE LOW is outputted from the INTOUT pin (The pulse width is about $1 \mu$ SEC.). Connect this signal to the IRQ port of the CPU; confirm the completion of the transfer before the CPU accesses the external bus.
In addition, use this function in the 65,536 color mode, as the displayed colors become strange when operating in the 64/4,096 color mode.
Image data is written to the displayed area and the write area specified in the write-area-specified register.

FROM for images

Diagram 10-1 Image Data Transfer Image

10-1 Accessing the FROM for images

When the image data transfer is stopped, it is possible to access the FROM for images from the CPU, and image data can be written.
For the amount of image data that can be stored in the FROM for images when its capacity is 64 Mbytes ( 512 Mbits ), with a QVGA ( $320 * 240$ pixels) image the size is as follows:
$320 * 240 * 2$ Bytes $=153.6 \mathrm{kBytes}$

Therefore, in the FROM for images, the following number of images can be saved.
$64 \mathrm{Mbytes} / 153.6 \mathrm{kBytes}=$ about 416 images

In VGA size (640*480 pixels), $640 * 480 * 2$ Bytes $=614.4 \mathrm{kBytes}$

Thus, in the FROM for images, the following number of images can be saved.

64Mbytes/614.4kBytes=about 104 images

The LCD controller provides 3-bit output pins A24~A22: FA24 (No. 206 pin), FA23 (No. 207 pin), and FA22 (No. 1 pin). As these pins are output pins, avoid connecting to the address signal line from the CPU. Connect to the address pin of the FROM for images from this pin. The 3-bit signal of A24~A22 outputs the contents of the FROM for images address register as-is.

## 10-2 Transfer Time of Image Data and Video Speed

The time required to read an image with the dimensions of $320 * 240$ from the FROM for images and write to the frame buffer memory is as follows.

$$
320 \times 240 \times 182.5 \mathrm{nsec}=14.02 \mathrm{msec}
$$

Therefore, video playback of 30 frames per second (about 33.3 msec cycle) is possible.
However, pixel size is $320 * 240$, when screen is refreshed by using the method of $10-3$, it is refreshed every two frames. As the VSYNC cycle is about 14.1 msec , it becomes a video playback of about 35 frames per second ( $=2 \times 14.1 \mathrm{msec}$ per frame) in practice.

Moreover, for the dimensions of 640*480 (in case of VGA size),
$640 \times 480 \times 182.5 \mathrm{nsec}=56.06 \mathrm{msec}$

Therefore, video playback of 15 frames per second (about 66.7 msec cycle) is possible.
However, when screen is refreshed by using the method of $10-3$, as the VSYNC cycle is about 14.1 msec , it becomes a video playback of about 14 frames per second $(=5 \times 14.1 \mathrm{msec}$ per frame) in practice.

## 10-3 About Video

By using the following method (Example: Image size is $640 * 480$, when screen is refreshed at 14 frames per second), video can be played back smoothly.
(1) Connect the VSYNC signal outputted from the LCD controller to the interrupt pin input of the CPU.
(2) Fill in an area (area 1, 2) with hard fill in a single color.
(3) If VSYNC interruption is detected, make area 1 the write area and area 2 the display area, and transfer the first image.
(4) With VSYNC interruption, after 5 frames ( 1 frame: about 14.1 msec ),
make area 1 the display area and area 2 the write area, and transfer the next image.
At this time, the image transferred in (3) is displayed.
(5) With VSYNC interruption, after 5 frames ( 1 frame: about 14.1 msec ), make area 1 the write area and area 2 the display area, and transfer the next image.
At this time, the image transferred in (4) is displayed.
(6) Smooth animation can be performed by repeating (4) and (5).

## 10-4 During Image Data Transfer

While transferring image data, the CPU bus is released, and because the LCD controller takes over the CPU bus, the CPU is unable to access the external bus during the transfer.
In addition, be aware that depending on the CPU type, there are those which practically stop processing during the bus release.

## 10-5 Transparency Function of Image Data

When writing image data as shown in Diagram 10-2 to the frame buffer memory (SDRAM), the Image Data Transparency Function can allow only the image data for the aqua-colored area to be written and, on the other hand, prevent the red area from being written. In this way, the background data written to the frame buffer memory can be kept while writing and displaying only the foreground image.

Diagram 10-2 Image Data

By only setting the necessary information in the following registers, (Regarding registers, refer to " 12 . About the Registers".), the above function can be used.

- Image Data Transparency Function Active/Inactive Register
- Image Data Transparency Color Specified Register

## 11. Self-refresh Function

This LCD controller includes a function to switch the SDRAM to a self-refresh state and thereby cut electric power consumption. The setting for changing the SDRAM to the self-refresh state is performed in the following registers. (Regarding registers, refer to "12. About the Registers".)

- Control Register 3 (DCR3)

In the normal state, when the SELFREF bit of the above register is set to " 1 ", the SDRAM shifts to the self-refresh state. At this time, the display becomes pitch-black. Conversely, in the self-refresh state, when the SELFREF bit of the above register is set to " 0 ", the normal state is restored and the screen is displayed.

Precautions:
In the self-refresh state, the SDRAM (read and write operations) is not accessed. Therefore, in the self-refresh state, avoid hard fill, line drawing, rectangle drawing, image data transfer, and writing image data from the CPU.

Additionally, avoid changing to the self-refresh state while performing the hard fill, line drawing, and rectangle drawing functions.

## 12. About the Registers

(1) Register for the Color Palette

Addresses 7FFF00H~7FFF7FH
There are 64 color palettes, and each can be set as 12 -bit ( 4,096 colors). The palette number must be set for drawing.
The write to the color palette register is possible for both in units of byte and word. In word access, the higher side of the data bus is G3~0, B3~0, the lower side of the data bus is R3~0.

Color Palette Address List

| Bit order | b7 | b6 | b5 | b4 | b3 | b2 | b1 |  | b0 | b7 | b6 | b5 | b4 | b3 | b2 | b1 | b0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $\begin{array}{\|l\|} \hline \begin{array}{l} \text { Color } \\ \text { format } \end{array} \\ \hline \end{array}$ | - | - | - | - | $\mathrm{R}$ | $\begin{array}{\|l\|} \hline \mathrm{R} \\ 2 \end{array}$ | $\mathrm{R}$ |  | $\mathrm{R}$ | G | $\mathrm{G}$ | $\mathrm{G}$ | $\mathrm{G}$ | B | B | B | B 0 |
| Palette 0 | 7FFF01H |  |  |  |  |  |  |  |  |  |  |  | 7FFF00H |  |  |  |  |
| Palette 1 | 7FFF03H |  |  |  |  |  |  |  |  |  |  | 7FFF02H |  |  |  |  |  |
| Palette 2 | 7FFF05H |  |  |  |  |  |  |  |  | 7FFF04H |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Palette 61 | 7FFF7BH |  |  |  |  |  |  |  |  | 7FFF7AH |  |  |  |  |  |  |  |
| Palette 62 | 7FFF7DH |  |  |  |  |  |  |  |  | 7FFF7CH |  |  |  |  |  |  |  |
| Palette 63 | 7FFF7FH |  |  |  |  |  |  |  |  | 7FFF7EH |  |  |  |  |  |  |  |

Example) Color Palette 63
Address $\quad$ 7FFF7EH (Even Address G, B)

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Name | $G 3$ | $G 2$ | $G 1$ | $G 0$ | $B 3$ | $B 2$ | $B 1$ | $B 0$ |
| $R / W$ | $W$ | $W$ | $W$ | $W$ | $W$ | $W$ | $W$ | $W$ |
| Initial <br> value | - | - | - | - | - | - | - | - |

Address $\quad$ 7FFF7FH (Odd Address $\quad R$ )

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Name |  |  |  |  | $R 3$ | $R 2$ | $R 1$ | $R 0$ |
| $R / W$ | $W$ | $W$ | $W$ | $W$ | $W$ | $W$ | $W$ | $W$ |
| Initial <br> value | - | - | - | - | - | - | - | - |

(2) FROM for Images Address Register (For bank switching)

Address 7FFFC0H

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Name | - | - | FA24 | FA23 | FA22 | - | - | - |
| R/W | W | W | W | W | W | W | W | W |
| Initial <br> value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

Use this register when accessing a high-capacity (512Mbit) FROM for images from the CPU and the high-order bit address of the CPU is insufficient.
Bit information set to bits 5, 4, 3 of this register is outputted from the No. 206, 207 and No. 1 pins of the LCD controller.
The register can be written to by byte or word access. For word access, set the data in the high-order byte (D15~8).
(3) Image-display Start-position X-coordinate-setting Register

Address 7FFFC2H

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Name | - | - | - | - | - | $\mathrm{X}(10)$ | $\mathrm{X}(9)$ | $\mathrm{X}(8)$ |
| R/W | - | - | - | - | - | W | W | W |
| Initial <br> value | - | - | - | - | - | 0 | 0 | 0 |

Address 7FFFC3H

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Name | $\mathrm{X}(7)$ | $\mathrm{X}(6)$ | $\mathrm{X}(5)$ | $\mathrm{X}(4)$ | $\mathrm{X}(3)$ | $\mathrm{X}(2)$ | $\mathrm{X}(1)$ | $\mathrm{X}(0)$ |
| $\mathrm{R} / \mathrm{W}$ | W | W | W | W | W | W | W | W |
| Initial <br> value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

This register sets the X-coordinate of the image display starting point. The setting range is $0 \sim 2,047$.
The limit is not applied on the LCD controller side.
The register can be written to by byte or word access.
(4) Image-display Start-position Y-coordinate-setting Register

Address 7FFFC4H

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Name | - | - | - | - | - | - | $\mathrm{Y}(9)$ | $\mathrm{Y}(8)$ |
| R/W | - | - | - | - | - | - | W | W |
| Initial <br> value | - | - | - | - | - | - | 0 | 0 |

Address 7FFFC5H

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Name | $\mathrm{Y}(7)$ | $\mathrm{Y}(6)$ | $\mathrm{Y}(5)$ | $\mathrm{Y}(4)$ | $\mathrm{Y}(3)$ | $\mathrm{Y}(2)$ | $\mathrm{Y}(1)$ | $\mathrm{Y}(0)$ |
| $\mathrm{R} / \mathrm{W}$ | W | W | W | W | W | W | W | W |
| Initial <br> value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

This register sets the Y -coordinate of the image display starting point. The setting range is $0 \sim 1,023$.
The limit is not applied on the FPGA side.
The register can be written to by byte or word access.
(5) Leading-address-setting Register for the Image Data Storage Location

Address 7FFFC6H

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Name | - | - | - | - | - | - | - | FA(24) |
| R/W | - | - | - | - | - | - | - | W |
| Initial <br> value | - | - | - | - | - | - | - | 0 |

Address 7FFFC7H

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Name | FA(23) | FA(22) | FA(21) | FA(20) | FA(19) | FA(18) | FA(17) | FA(16) |
| R/W | W | W | W | W | W | W | W | W |
| Initial <br> value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

Address 7FFFC8H

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Name | $\mathrm{FA}(15)$ | $\mathrm{FA}(14)$ | $\mathrm{FA}(13)$ | $\mathrm{FA}(12)$ | $\mathrm{FA}(11)$ | FA(10) | FA(9) | FA(8) |
| R/W | W | W | W | W | W | W | W | W |
| Initial <br> value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

Address 7FFFC9H

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Name | FA(7) | FA(6) | FA(5) | FA(4) | FA(3) | FA(2) | FA(1) | FA(0) |
| R/W | W | W | W | W | W | W | W | W |
| Initial <br> value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

This register sets the leading address of the FROM where image data is stored. The setting range is $0 \mathrm{H} \sim 01 \mathrm{FFFFFFH}$.
The register can be written to by byte or word access. In word access, write using two steps: "7FFFC6H ~ 7FFFC7H" and "7FFFC8H ~ 7FFFC9H".
(6) Image-data Display-size Width-setting Register

Address 7FFFCAH

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Name | - | - | - | - | $\mathrm{XH}(11)$ | $\mathrm{XH}(10)$ | $\mathrm{XH}(9)$ | $\mathrm{XH}(8)$ |
| R/W | - | - | - | - | W | W | W | W |
| Initial <br> value | - | - | - | - | 0 | 0 | 0 | 0 |

Address 7FFFCBH

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Name | $\mathrm{XH}(7)$ | $\mathrm{XH}(6)$ | $\mathrm{XH}(5)$ | $\mathrm{XH}(4)$ | $\mathrm{XH}(3)$ | $\mathrm{XH}(2)$ | $\mathrm{XH}(1)$ | $\mathrm{XH}(0)$ |
| R/W | W | W | W | W | W | W | W | W |
| Initial <br> value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

This register sets the display width of image to display.
The setting range is $1 \sim 2,048$.
The limit is not applied on the LCD controller side.
The register can be written to by byte or word access.
(7) Image-data Display-size Line-number-setting Register

Address 7FFFCCH

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Name | - | - | - | - | - | $\mathrm{YV}(10)$ | $\mathrm{YV}(9)$ | $\mathrm{YV}(8)$ |
| R/W | - | - | - | - | - | W | W | W |
| Initial <br> value | - | - | - | - | - | 0 | 0 | 0 |

Address 7FFFCDH

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Name | $\mathrm{YV}(7)$ | $\mathrm{YV}(6)$ | $\mathrm{YV}(5)$ | $\mathrm{YV}(4)$ | $\mathrm{YV}(3)$ | $\mathrm{YV}(2)$ | $\mathrm{YV}(1)$ | $\mathrm{YV}(0)$ |
| R/W | W | W | W | W | W | W | W | W |
| Initial <br> value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

This register sets the display line number of image to display.
The setting range is $1 \sim 1,024$.
The limit is not applied on the LCD cotroller side.
The register can be written to by byte or word access.
(8) Image Control Register

Address 7FFFCEH (Write side)

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Name | - | - | - | - | - | - | - | ST |
| R/W | - | - | - | - | - | - | - | W |
| Initial <br> value | - | - | - | - | - | - | - | 0 |

This register sets the transfer start command for image data.

Bit 0 carries out the start instruction for image data transfer.

| ST | Explanation |
| :---: | :--- |
| 1 | Transfer of image data is started. |
| 0 | This is an initial value or is returned to 0 after <br> starting operation. |

When the transfer of image data is completed, a one-shot signal of the

ACTIVE LOW is outputted from the INTOUT signal of the LCD controller. The pulse width is about $1 \mu \mathrm{SEC}$. With IRQ interruption processing, the CPU side can setup and start transfer of the next image data.
(9) Drawing X-coordinates-starting-point Setting Register

Address 7FFFD0H

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Name | - | - | - | - | - | $\mathrm{X}(10)$ | $\mathrm{X}(9)$ | $\mathrm{X}(8)$ |
| R/W | - | - | - | - | - | W | W | W |
| Initial <br> value | - | - | - | - | - | 0 | 0 | 0 |

Address 7FFFD1H

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Name | $\mathrm{X}(7)$ | $\mathrm{X}(6)$ | $\mathrm{X}(5)$ | $\mathrm{X}(4)$ | $\mathrm{X}(3)$ | $\mathrm{X}(2)$ | $\mathrm{X}(1)$ | $\mathrm{X}(0)$ |
| $\mathrm{R} / \mathrm{W}$ | W | W | W | W | W | W | W | W |
| Initial <br> value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

This register sets the X starting point coordinates of the drawing data.
The setting range is $0 \sim 2,047$.
The limit is not applied on the LCD controller side.
The register can be written to by byte or word access.
It is the same as the Arbitrary Rectangle Fill-in and Line-drawing Functions
(10) Drawing X-coordinates-starting-point Setting Register

Address 7FFFD2H

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Name | - | - | - | - | - | - | $\mathrm{Y}(9)$ | $\mathrm{Y}(8)$ |
| R/W | - | - | - | - | - | - | W | W |
| Initial <br> value | - | - | - | - | - | - | 0 | 0 |

Address 7FFFD3H

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Name | $\mathrm{Y}(7)$ | $\mathrm{Y}(6)$ | $\mathrm{Y}(5)$ | $\mathrm{Y}(4)$ | $\mathrm{Y}(3)$ | $\mathrm{Y}(2)$ | $\mathrm{Y}(1)$ | $\mathrm{Y}(0)$ |
| R/W | W | W | W | W | W | W | W | W |
| Initial <br> value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

This register sets the Y starting point coordinates of the drawing data.
The setting range is $0 \sim 1,023$.
The limit is not applied on the LCD controller side.
The register can be written to by byte or word access.
It is the same as the Arbitrary Rectangle Fill-in and Line-drawing Functions.
(11) Drawing X-coordinates-ending-point Setting Register

Address 7FFFD4H

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Name | - | - | - | - | - | $\mathrm{X}(10)$ | $\mathrm{X}(9)$ | $\mathrm{X}(8)$ |
| R/W | - | - | - | - | - | W | W | W |
| Initial <br> value | - | - | - | - | - | 0 | 0 | 0 |

Address 7FFFD5H

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Name | $\mathrm{X}(7)$ | $\mathrm{X}(6)$ | $\mathrm{X}(5)$ | $\mathrm{X}(4)$ | $\mathrm{X}(3)$ | $\mathrm{X}(2)$ | $\mathrm{X}(1)$ | $\mathrm{X}(0)$ |
| $\mathrm{R} / \mathrm{W}$ | W | W | W | W | W | W | W | W |
| Initial <br> value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

This register sets the X ending point coordinates of the drawing data.
The setting range is $0 \sim 2,047$.
The limit is not applied on the LCD controller side.
The register can be written to by byte or word access.
It is the same as the Arbitrary Rectangle Fill-in and Line-drawing Functions.
(12) Drawing Y-coordinates-ending-point Setting Register

Address 7FFFD6H

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Name | - | - | - | - | - | - | $\mathrm{Y}(9)$ | $\mathrm{Y}(8)$ |
| R/W | - | - | - | - | - | - | W | W |
| Initial <br> value | - | - | - | - | - | - | 0 | 0 |

Address 7FFFD7H

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Name | $\mathrm{Y}(7)$ | $\mathrm{Y}(6)$ | $\mathrm{Y}(5)$ | $\mathrm{Y}(4)$ | $\mathrm{Y}(3)$ | $\mathrm{Y}(2)$ | $\mathrm{Y}(1)$ | $\mathrm{Y}(0)$ |
| $\mathrm{R} / \mathrm{W}$ | W | W | W | W | W | W | W | W |
| Initial <br> value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

This register sets the Y ending point coordinates of the drawing data.
The setting range is $0 \sim 1,023$.
The limit is not applied on the LCD controller side.
The register can be written to by byte or word access.
It is the same as the Arbitrary Rectangle Fill-in and Line-drawing Functions.
(13) Drawing Color-Specified Register

- 64/4,096 color mode

In 64/4,096 color mode, the palette number must be set.
Address 7FFFD9H

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Name | M 1 | M 0 | P 5 | P 4 | P 3 | P 2 | P 1 | P 0 |
| R/W | W | W | W | W | W | W | W | W |
| Initial <br> value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

- 65,536 color mode

Address 7FFFD8H

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Name | R 4 | R 3 | R 2 | R 1 | R 0 | G 5 | G 4 | G 3 |
| $\mathrm{R} / \mathrm{W}$ | W | W | W | W | W | W | W | W |
| Initial <br> value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

Address 7FFFD9H

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Name | G2 | G1 | G0 | B4 | B3 | B2 | B1 | B0 |
| R/W | W | W | W | W | W | W | W | W |
| Initial <br> value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

This register sets the display colors of the drawing data.
The register can be written to by byte or word access.
It is the same as the Arbitrary Rectangle Fill-in and Line-drawing Functions and Hard Fill.
(14) Rectangle Fill-in Start Register

Address 7FFFDAH

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Name | - | - | - | - | - | - | - | ST |
| R/W | - | - | - | - | - | - | - | W |
| Initial <br> value | - | - | - | - | - | - | - | 0 |

This register sets the start command for rectangle fill-in.

Bit 0 carries out the start instruction for rectangle fill-in.

| ST | Explanation |
| :---: | :--- |
| 1 | Rectangle fill-in is started. |
| 0 | This is an initial value or is returned to 0 after <br> starting operation. |

Caution) At the completion of the operation, a one-shot signal of the ACTIVE LOW is outputted from the INTOUT signal of the LCD controller (The pulse width is about $1 \mu \mathrm{SEC}$.).
(15) Line Drawing Start Register

Address 7FFFDCH

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Name | - | - | - | - | - | - | - | ST |
| R/W | - | - | - | - | - | - | - | W |
| Initial <br> value | - | - | - | - | - | - | - | 0 |

This register sets the start command for line drawing.

Bit 0 carries out the start instruction for the line drawing.

| ST | Explanation |
| :---: | :--- |
| 1 | Line drawing is started. |
| 0 | This is an initial value or is returned to 0 after <br> starting operation. |

Caution) At the completion of the operation, a one-shot signal of the ACTIVE LOW is outputted from the INTOUT signal of the LCD controller (The pulse width is about $1 \mu \mathrm{SEC}$.).
(16) Display-start X-coordinate-setting Register

Address 7FFFDEH

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Name | - | - | - | - | - | $\mathrm{X}(10)$ | $\mathrm{X}(9)$ | $\mathrm{X}(8)$ |
| R/W | - | - | - | - | - | W | W | W |
| Initial <br> value | - | - | - | - | - | 0 | 0 | 0 |

Address 7FFFDFH

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Name | $\mathrm{X}(7)$ | $\mathrm{X}(6)$ | $\mathrm{X}(5)$ | $\mathrm{X}(4)$ | $\mathrm{X}(3)$ | $\mathrm{X}(2)$ | $\mathrm{X}(1)$ | $\mathrm{X}(0)$ |
| $\mathrm{R} / \mathrm{W}$ | W | W | W | W | W | W | W | W |
| Initial <br> value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

This register sets the display start X -axis coordinates.
The setting range is $0 \sim 2,047$.

The limit is not applied on the LCD controller side.
The register can be written to by byte or word access.
The content of this register is reflected from the time it is written by the CPU when the next display frame is started.
(17) Display-start Y-coordinate-setting Register

Address 7FFFE0H

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Name | - | - | - | - | - | - | $\mathrm{Y}(9)$ | $\mathrm{Y}(8)$ |
| R/W | - | - | - | - | - | - | W | W |
| Initial <br> value | - | - | - | - | - | - | 0 | 0 |

Address 7FFFE1H

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Name | $\mathrm{Y}(7)$ | $\mathrm{Y}(6)$ | $\mathrm{Y}(5)$ | $\mathrm{Y}(4)$ | $\mathrm{Y}(3)$ | $\mathrm{Y}(2)$ | $\mathrm{Y}(1)$ | $\mathrm{Y}(0)$ |
| $\mathrm{R} / \mathrm{W}$ | W | W | W | W | W | W | W | W |
| Initial <br> value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

This register sets the display start Y -axis coordinates.
The setting range is $0 \sim 1,023$.
The limit is not applied on the LCD controller side.
The register can be written in byte or word access.
The content of this register is reflected from the time it is written by the CPU when the next display frame is started.
(18) Display Area and Write Area-Specified Register

Address 7FFFE2H

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Name | - | - | - | - | DISP <br> AREA1 | DISP <br> AREA0 | WR <br> AREA1 | WR <br> AREA0 |
| R/W | - | - | - | - | W | W | W | W |
| Initial <br> value | - | - | - | - | 0 | 0 | 0 | 0 |

This register specifies the display and write areas in the frame buffer
memory area.
The drawing data from the CPU, drawing function (Line drawing, Rectangle fill-in, and Image data transfer), and hard fill data are wriiten to a specigied write area.

Bits 3~2

| DISP <br> AREA1 | DISPA <br> ARE |  | Explanation |
| :---: | :---: | :--- | :--- |
| 0 | 0 | Display the area 1 |  |
| 0 | 1 | Display the area 2 |  |
| 1 | 0 | Display the area 3 |  |
| 1 | 1 | Display the area 4 |  |

Bits 1~0

| WR <br> AREA1 | WR <br> AREA0 |  | Explanation |
| :---: | :---: | :--- | :--- |
| 0 | 0 | Write to the area 1 |  |
| 0 | 1 | Write to the area 2 |  |
| 1 | 0 | Write to the area 3 |  |
| 1 | 1 | Write to the area 4 |  |

(19) Image Data Transparency Function Active/Inactive Register

This register is for setting whether to write to the frame buffer memory the color specified in the image data transparency specified register when transferring image data.

Bit 0

| IDPEN <br> A | Explanation |
| :---: | :--- |
| 1 | Image Data Transmission Function active (the color <br> specified in the Image Data Transparency Color <br> Specified Register is not written.) |
| 0 | Image Data Transparency Function inactive (initial <br> value and the color specified in the Image Data <br> Transparency Color Specified Register is also <br> written.) |

(20) Image Data Transparency Color Specified Register

Address 7FFFE4H

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Name | R 4 | R 3 | R 2 | R 1 | R 0 | G 5 | G 4 | G 3 |
| $\mathrm{R} / \mathrm{W}$ | W | W | W | W | W | W | W | W |
| Initial <br> value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

Address 7FFFE5H

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Name | G 2 | G 1 | G 0 | B 4 | B 3 | B 2 | B 1 | B 0 |
| R/W | W | W | W | W | W | W | W | W |
| Initial <br> value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

This register is for setting the image data transparency color. With the Image Data Transparency Function set to "active" in the Image Data Transparency Active/inactive Register, when executing image data transfer, the color specified in this register is not written to the frame buffer memory.
(21) X-coordinate Obtained-data Register of the Touch Panel

- In the case of KS-R8TPC

Address 7FFFF0H

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Name | ADB7 | ADB6 | ADB5 | ADB4 | ADB3 | ADB2 | ADB1 | ADB0 |
| R/W | R | R | R | R | R | R | R | R |
| Initial <br> value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

Address 7FFFF1H

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Name | - | - | - | - | - | - | - | - |
| $\mathrm{R} / \mathrm{W}$ | R | R | R | R | R | R | R | R |
| Initial <br> value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

KS-R8TPC has an 8-bit A/D conversion function; this conversion result is received by KS-LTWV-SD (LVDS) and housed to the register automatically. The data is housed to the higher 8 -bits. Sampling speed is continuously performed at around $5 \mathrm{mS} \sim 8 \mathrm{mS}$, and read from the above register is always possible.
With this function, an interface without excessive hardware (analog joystick, analog touch panel, or other analog sensors) is possible.

- In the case of KS-R10TPC

Address 7FFFF0H

KS-R10TPC has a 10-bit A/D conversion function; this conversion result is received by KS-LTWV-SD (LVDS) and housed to the register automatically. The data is housed to the higher 8 -bits and higher 2 -bits for the lower byte. Sampling speed is continuously performed at around $5 \mathrm{mS} \sim 8 \mathrm{mS}$, and read from the above register is always possible.
With this function, an interface without excessive hardware (analog joystick, analog touch panel, or other analog sensors) is possible.
(22) Y-coordinate Obtained-data Register of the Touch Panel

- In the case of KS-R8TPC

Address 7FFFF2H

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Name | ADB7 | ADB6 | ADB5 | ADB4 | ADB3 | ADB2 | ADB1 | ADB0 |
| R/W | R | R | R | R | R | R | R | R |
| Initial <br> value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

Address 7FFFF3H

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

The function of the register is like X-coordinate obtained data register of the touch panel can also read A/D conversion results.
(23) PWM Frequency Setting Register

Address 7FFFF6H

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Name | PF15 | PF14 | PF13 | PF12 | PF11 | PF10 | PF9 | PF8 |
| R/W | W | W | W | W | W | W | W | W |
| Initial <br> value | 0 | 0 | 1 | 0 | 0 | 1 | 0 | 1 |

Address 7FFFF7H

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Name | PF7 | PF6 | PF5 | PF4 | PF3 | PF2 | PF1 | PF0 |
| R/W | W | W | W | W | W | W | W | W |
| Initial <br> value | 0 | 1 | 1 | 1 | 0 | 1 | 0 | 1 |

This register sets the frequency of the PWM. Use the following formula to set the value of the register.

Register value $=(\Phi /$ PWM frequency $)-1$

$$
\Phi=4.79525 \mathrm{MHz}
$$

For example, if you want to set the PWM frequency to " 500 Hz ",

Register value $=(4.79525 \mathrm{MHz} / 500 \mathrm{~Hz})-1$

$$
=9,589(\text { decimal places truncated })
$$

Set " 9,589 " in the register.
The initial value of the register is 9,589 and the PWM frequency is 500 Hz .

The setting range is from 1 (PWM frequency: about 2.4 MHz ) to 65,534 (PWM frequency: about 73 Hz ).

## (24) PWM ON Width Setting Register

Address 7FFFF8H

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Name | PW15 | PW14 | PW13 | PW12 | PW11 | PW10 | PW9 | PW8 |
| R/W | W | W | W | W | W | W | W | W |
| Initial <br> value | 0 | 0 | 1 | 0 | 0 | 1 | 0 | 1 |

Address 7FFFF9H

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Name | PW7 | PW6 | PW5 | PW4 | PW3 | PW2 | PW1 | PW0 |
| R/W | W | W | W | W | W | W | W | W |
| Initial <br> value | 0 | 1 | 1 | 1 | 0 | 1 | 1 | 0 |

This register sets the ON width of the PWM. Use the following formula to set the value of the register.
$\begin{aligned} \text { Register value }= & ((\text { PWM frequency setting register }+1) * \mathrm{ON} \text { width } \\ & {[\%]) / 100 }\end{aligned}$

For example, if you want to set the PWM frequency to " 500 Hz ", and set ON width to " $100 \%$ ",

Register value $=((9,589+1) * 100 \%) / 100$

$$
=9,590(\text { decimal places truncated })
$$

Set " 9,590 " in the register.
Initial value of the register is " 9,590 " and the PWM frequency is 500 Hz , and the ON width is $100 \%$.
(25) Control Register 3 (DCR3)

Address 7FFFFBH (Write side)

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Name | - | - | - | - | SELFREF | U/D | R/L | BLI |
| R/W | - | - | - | - | W | W | W | W |
| Initial <br> value | - | - | - | - | 0 | 0 | 0 | 1 |

DCR3 controls the LCD display, the ON/OFF for the backlight, and the self-refresh for the SDRAM.

Bit 3 controls the self-refresh of the SDRAM

| Register <br> Setting | Explanation |
| :---: | :--- |
| SELFREF | 1 If it is in the self-refresh state, it will return to the <br> normal state. <br> 1 If it is in the normal state, it will shift to the self-refresh <br> mode. |

Bits 2~1 controls the display direction.

| Register Setting Value |  | Display Switching <br> Output Signal |  | Display orientation <br> Explanation |
| :---: | :---: | :---: | :---: | :---: |
| U/D | R/L | U/D | R/L |  |
| 0 | 0 | 0 | 0 |  |
| 0 | 1 | 0 | 1 | Refer to the LCD |
| data sheet. |  |  |  |  |
| 1 | 0 | 1 | 0 |  |
| 1 | 1 | 1 | 1 |  |

Bit 0

| Register <br> Setting | Output <br> Signal | Explanation |
| :---: | :---: | :--- |
| BLI | BLEN |  |
| 0 | 1 | Backlight off |
| 1 | 0 | Backlight on |

- When setting the BLI bit " 0 ", PWM output is fixed in LOW.
(26) Control Register 1 (DCR1)

Address 7FFFFCH (Write side)

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Name | MOD <br> E | BLK2 | BLK1 | PEE | BK1 | BK0 | FR1 | FR0 |
| R/W | W | W | W | W | W | W | W | W |
| Initial <br> value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

DCR1 sets the foreground/background of the frame buffer (2 pages), controls transmission display, controls Blink 1 and 2, and controls ON/OFF display.

Bit 7

| MODE | Explanation |
| :---: | :--- |
| 0 | 4,096 colors in 64 color mode. |
| 1 | 65,536 color mode. |

Bits 6~5

| BLK2 | BLK1 |  |
| :---: | :---: | :--- |
| 0 |  | Blink 2 inactive. |
| 1 |  | Blink 2 active. |
|  | 0 | Blink 1 inactive. |
|  | 1 | Blink 1 active. |

(Note) Blink 2 can blink at a higher speed than blink 1.
Blinking cycle for each LCD controller is as follows.

Blink 1 blinking cycle ••• About 1 second
Blink 2 blinking cycle • • About 0.5 second

Bit 4

| PEE | Explanation |
| :---: | :--- |
| 0 | Transmission display inactive. |
| 1 | Transmission display active. |

(Caution) Only in the 4,096 color mode. Transparent display is possible between pages in the same area. Transparent display of pages in different areas is not possible.

Bits 3~2

| BK1 | BK0 | Explanation |
| :---: | :---: | :--- | :--- |
| 0 | 0 | The background page is Page 0. |
| 0 | 1 | The background page is Page 1. |
| 1 | 0 | Inactive setting. |
| 1 | 1 | Inactive setting. |

Bits 1~0

| FR1 | FR0 | Explanation |
| :---: | :---: | :--- | :--- |
| 0 | 0 | The foreground page is Page 0. |
| 0 | 1 | The foreground page is Page 1. |
| 1 | 0 | Inactive setting. |
| 1 | 1 | Inactive setting. |

(27) Control Register 2 (DCR2)

Address 7FFFFDH (Write side)

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Name | - | - | - | - | - | - | WFB <br> 1 | WFB <br> 0 |
| R/W | W | W | W | W | W | W | W | W |
| Initial <br> value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

DCR2 sets the write page (2 pages) in the area. The drawing data from the CPU, the drawing data from inside of the LCDC, and the hard fill data is written to the specified write page. These settings are effective only in the $64 / 4,096$ color mode.

The drawing data from inside of the LCDC includes the following:

- Line drawing
- Arbitrary Rectangle Fill-in

Bits 1~0

| WFB1 | WFB0 |  |
| :---: | :---: | :--- |
| 0 | 0 | Write page is set to page 0. |
| 0 | 1 | Write page is set to page 1. |
| 1 | 0 | Inactive setting. |
| 1 | 1 | Inactive setting. |

Caution) In the 65,536 color mode, write is performed to Page0 and Page1 without regard to the setting of this bit.
(28) Hard Fill Command Register (CFCR)

Address 7FFFFFH

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Name | - | - | - | - | - | - | - | BUS <br> Y |
| R/W | - | - | - | - | - | - | - | R/W |
| Initial <br> value | - | - | - | - | - | - | - | 0 |

In 64/4,096 color mode, with the palette number housed in the drawing color specified register, color data from the color palette register is selected, and the data is used to fill the frame buffer for the page set in the WFB bit of DCR2.
In 65,536 color mode, with the displayed color housed in the drawing color-specified register, the frame buffer is filled.
And, it is performed to the write area specified in Display Area and Write Area-specified Register.
To implement, simply write any data to the register.
(Caution)
When writing to the frame buffer directly after executing this command, write cannot be performed normally. Wait for at least 84 mS or longer, or confirm that bit 0 changes from 1 to 0 before shifting to the next write operation. (Bit 0 is the BUSY bit which outputs 1 directly after a hard clear command is issued, and goes back to 0 when completed.) And, during the hard fill operation, avoid executing other drawing functions (Line Drawing Function, Arbitrary Rectangle Fill-in Function, Image Data Transfer Function), too.
The LCD controller features an INTOUT pin. After the completion of hard fill, the active LOW signal is output from this pin, as shown in the following diagram.
In addition, the LOW width of the signal (INTOUTPW) is about 1 horizontal period (about $26.7 \mu \mathrm{sec}$ ).
By connecting this signal to the IRQ (interrupt) port of the CPU, the completion of hard fill can be detected by interruption.

## 13. External Dimensions

| KS-LTWV-SD(LVDS) |  |  |  |  |  |
| :--- | :--- | :--- | :--- | :---: | :---: |
| Sign | MIN(mm) | NOM(mm) | MAX(mm) |  |  |
| A |  |  | 4.10 |  |  |
| A1 | 0.25 |  | 0.5 |  |  |
| A2 | 3.2 | 3.4 | 3.6 |  |  |
| D | 30.60 |  |  |  | BSC |
| E1 | 28.00 |  |  |  | BSC |
| e | 0.50 |  |  |  |  |
| BSC |  |  |  |  |  |
| b | 0.17 | - | 0.27 |  |  |
| c | 0.09 | - | 0.20 |  |  |
| L | 0.45 | 0.60 | 0.75 |  |  |
| N | 208 |  |  |  |  |

## 14. External Dimensions

1) When Powering on

The LCD controller is a type that forwards configuration data from the flash memory inside the device to the SRAM.
After powering on, it starts quickly after disengaging the reset. However, the hard fill starts soon after powering on. When designing software, ensure that it checks the completion of the hard fill in the hard fill register before allowing read-write access.

## 15. Handling Precautions

1) Transport

Handle the Product and the packaging carefully. Do not throw or drop, as this can cause damage to the Product. When transporting, avoid mechanical vibration and shock as much as possible.
Moreover, avoid the Product getting wet during times of rain and snow, as it has a negative influence on the effectiveness of the antistatic materials (magazine, etc.) and the main Product itself.
2) Storage
(1) Avoid storing in areas at risk of water leakage and direct sunlight (be particularly careful during times of rain and snow.)
(2) Do not stack packaging boxes upside down or sideways.
(3) The recommended ambient conditions for storage are a constant temperature and humidity in the ranges of $5 \sim 35^{\circ} \mathrm{C}$ and $40 \sim 75 \%$, respectively.
(4) Avoid storing in areas prone to noxious fumes (in particular, corrosive gases) and high levels of dust.
(5) Sudden temperature changes during storage result in condensation, causing the oxidation of leads and corrosion, and thus the deterioration of solder wettability. Store in areas not subject to frequent changes in temperature.
(6) After taking the Product out of the package, use an antistatic container when storing again.
(7) When storing, do not directly apply any loads on the Product.
(8) After an extended period of normal storage (2 years or more), it is recommended to check the solderability and electrical characteristics before use.
3) Inspection
(1) Grounding
(1) Properly ground the floor, worktable, conveyor, floor mat, etc. so as to avoid a buildup of static electricity. In particular, always ground the worktable which has direct contact with the device and the antistatic floor mat (100k~100M $/ \mathrm{cm}^{2}$ ).
(2) Always ground the electronic measuring instruments, the jig, and the soldering iron.
(3) Workers should wear antistatic work wear, and the worker's body should be
grounded using an antistatic wrist strap. The antistatic wrist strap should be grounded at a resistance of about $0.5 \sim 1.0 \mathrm{M} \Omega$.
(2) Electrical Leakage

Leakage from the electrical inspection equipment and/or the Product-embedded system itself should be avoided to prevent damage to the semiconductors in the device, but above all for the worker's safety. Prior to using the circuit tester, curve tracer, synchroscope, other measuring instruments or other equipment such as the soldering iron that directly comes into contact with the Product, ensure that there is no leakage before grounding.
(3) Order of Inspection
(1) Before inspecting the Product, check for proper grounding and any leakage as described above. Additionally, apply voltage to the Product only after inserting into a jig. When doing so, avoid sudden startups and shut downs of the power supply.
(2) After completing inspection of the Product, switch off the applied voltage before removing it from the jig. If removed while powered on, deterioration and/or damage to the Product may occur.
(4) Electric Shock

During electrical measurement, there is possibility of electric shock from the lead or wiring, the connectors, the envelope, and/or the heat sink. Avoid bodily contact while powered on.
4) ESD (Deterioration/Damage from Electrostatic Discharge)

When handling the Product by itself, ensure that the environment is as static-free as possible, workers wear antistatic clothes, containers that have direct contact with the Product use antistatic material, and that proper grounding is used, with a resistance of $0.5 \sim 1.0 \mathrm{M} \Omega$.
(1) Management of the Work Environment
(1) When humidity decreases, static electricity can build up through friction. The recommended humidity level is $40 \sim 60 \%$, after considering moisture absorption caused by the opening of moisture proof product packaging.
(2) Ground all equipment and jigs installed within the workspace.
(3) Place and ground conductive mats on the workspace floor to prevent static electricity buildup on the floor (surface resistance $10^{4} \sim 10^{8} \Omega /$ sq., resistance between surface and grounding $7.5 \times 10^{5} \sim 10^{8} \Omega / \mathrm{sq}$.).
(4) Place and ground conductive mats (with resistance capability) on the worktable surface to diffuse static electricity (surface resistance:
$10^{4} \sim 10^{8} \Omega /$ sq. resistance between surface and grounding: $7.5 \times 10^{5} \sim 10^{8} \Omega /$ sq.). Avoid using a metal surface for the worktable that can create a sudden electrostatic discharge with low resistance when the Product comes into direct contact with it.
(5) When using automated equipment, be careful of the following points.
(a) When picking up the IC package surface by vacuum, use conductive rubber at the pickup's tip to prevent electrostatic buildup.
(b) Minimize friction to the IC package surface. When friction can't be avoided due to the system, decrease the friction surface, or use materials with a smaller friction coefficient or electrical resistance, or consider using an ionizer.
(c) Use electrostatic dissipation materials for parts that come into contact with the lead pin of the Product.
(d) Avoid the Product coming into contact with electrostatically-charged objects (human body, work clothes, etc.).
(e) Utilize a tape carrier that uses a low-resistance material in the part where the tape comes into contact.
(f) Avoid contact between the jig equipment and the Product during the manufacturing process.
(g) For manufacturing processes that cause the package to become electrostatically charged, use an ionizer to neutralize the charge.
(6) In the workspace, use a VDT filter to prevent electrostatic buildup on the CRT surface, and avoid switching on and off as much as possible during work. This is to prevent electromagnetic induction to the device.
(7) Regularly measure the electrostatic potential of the workspace, to ensure that there is no buildup.
(8) Use antistatic fiber covers on chairs, and ground the chairs to the floor with a grounding chain. (Resistance between chair surface and grounding chain: $7.5 \times 10^{5} \sim 10^{12} \Omega /$ sq.)
(9) Place antistatic mats on storage shelf surfaces.
(Surface resistance: $10^{4 \sim} 10^{8} \Omega / \mathrm{sq}$., resistance between surface and grounding: $7.5 \times 10^{5} \sim 10^{8} \Omega /$ sq.)
(10) For shipping and temporary storage containers for the device (box, jig, bag, etc.), use a container made of electrostatic dissipation or antistatic material.
(11) As for carts, use electrostatically conductive materials for surfaces that come into contact with the Product packaging, and ground to the floor by using a
grounding chain. (Resistance between cart surface and grounding chain: $7.5 \times 10^{5 \sim} 10^{10} \Omega /$ sq.)
(12) For electrostatically-controlled areas, place a grounding conductor exclusively for static electricity. For this grounding conductor, use a power transmission grounding conductor (class three and above or equivalent) or underground grounding conductor. In addition, it is recommended to separate it from the equipment grounding when feasible.
(2) Work Precautions
(1) Workers should wear anti-static clothes and conductive shoes (or heel strap, leg strap).
(2) Workers should also wear a wrist strap, grounded with a resistance of about $1.0 \mathrm{M} \Omega$.
(3) Ground the tip of the soldering iron, and use with a low voltage ( $6 \mathrm{~V} \sim 24 \mathrm{~V}$ ).
(4) Tweezers have a potential of contacting the Product's pins; as such, use an antistatic type and avoid metal tweezers as much as possible. With low resistance, metal tweezers can cause a sudden discharge from a charged Product. When utilizing vacuum tweezers, use a conductivity adsorption pad on the tip and ground using a grounding conductor exclusively for static electricity. (Resistance: 104~1010 $\Omega$ )
(5) Do not place the Product and its container near areas with a high electric field (eg. on the CRT, etc.).
(6) When stacking PCBs with mounted semiconductors, place antistatic boards in between to avoid direct contact. Otherwise, static buildup and discharge may occur.
(7) When bringing in items into an electrostatically-controlled area (clipboard, etc.), use items made of antistatic material as much as possible.
(8) When touching the Product directly, wear antistatic gloves or finger cots/stalls. (Resistance: $10^{8} \Omega$ and under)
(9) When placing safety covers for equipment near the device, use covers with a resistance of $10^{9} \Omega$ and under.
(10) When use of a wrist strap is impossible, and friction to the device is likely, use an ionizer.
5) Disposal Precaution

When disposing of the device and the packaging. Please consider the environment and follow all local laws and regulations.

## 16. Operating Condition Precautions

## 1) Ambient Temperature

As a rule, semiconductors are more sensitive to the temperature than other components. As the various electrical characteristics are limited by operating temperature, determine the temperature environment in advance, and consider derating when designing the device. Furthermore, use of the Product beyond specifications not only means that the electrical characteristics cannot be guaranteed, but can also cause deterioration of the device.
2) Ambient Humidity

Molded devices are not perfectly airtight. Therefore, long-term use in highly humid environments can cause deterioration and damage to the semiconductor chips due to moisture penetration.
Moreover, for normal PCBs, highly humid environments can lead to lowered impedance between wirings. Therefore, for systems with high signal source impedance, these substrate leaks and leaks between pins in the Product can cause malfunctions. In such cases, consider humidity-proofing the Product surface. On the other hand, in low humidity, damage due to electrostatic discharge can become a problem, so use within a humidity range of $40 \sim 60 \%$ when not particularly humidity-proofing.
3) Corrosive Gas

Beware that corrosive gas can affect the device and cause deterioration of electrical characteristics.
An example of this is rubber near the device releases sulfuric gas (or condensation in high humidity), resulting in corrosion to leads, crystallization due to chemical reaction between leads and ensuing leakage.
4) Radiation/Cosmic rays

Generally, devices are not designed to resist radiation and cosmic rays. Therefore, for space applications and in environments with radiation, it is necessary to design specific protection for these factors.
5) Intense Electric Field/Magnetic Field

When the Product is exposed to magnetic fields, abnormal phenomenon (impedance variation and increase of current leaks, etc.) can occur due to polarization of the plastic material and the IC chip internals.
There was also a reported case of malfunction due to the installation of the LSI near the deflection yoke of a television set. In such cases, changing the
installation location and/or deploying an electromagnetic shield maybe necessary. In particular, in an alternating magnetic field, a shield is necessary due to the occurrence of electromotive forces.
6) Vibration/Impact/Stress

Cannon type devices with a hollow interior and those with a ceramic seal are vulnerable to vibration and shock because internal wire connections are not fixed. However, in actual devices, there have been reports that vibration, shock, or stress to soldered parts and connections leading to the snapping of wires. Therefore, care is necessary in designing equipment with a high vibration rate. It is also known that when stress is applied to the semiconductor chip through the package, a change in internal chip resistance can be caused by the Piezo effect. For analog circuits, be careful of stress to the package, as well. In particular, strong vibration, shock, or stress, can cause cracks in the package or chip.
7) Ambient Light (ultraviolet rays, sunlight, fluorescent lights, lamps, etc.)

When semiconductor devices are exposed to light, malfunctions can occur due to striking voltage caused by a photoelectric effect. In particular, devices with a view of the internal chip are affected by this, so the design should not allow ambient light to enter. Care must be taken as devices other than photo semiconductors and EP-ROMs can be affected by this.
8) Dust/Oil

Similar to corrosive gas, chemical reactions may occur in the device due to dust or oil. As such, avoid environments where dust and oil can enter the device, since they can affect the device characteristics. Care must be taken in designing optical devices, since, in addition to the above, optical characteristics can be affected.
9) Smoke/Fire

Semiconductor devices and modular devices are not fire-resistant, and as such, combustion is possible. In such cases, the device may emit toxic gases.
Therefore, avoid areas with open flames, heated elements, and combustible/flammable objects.

## 17. Installation Method

The following are the reflow conditions for the LCD controller and touch panel controller. For more details, please make an inquiry to our sales staff.

## 1) LCD Controller KS-LTWV-SD (LVDS)

The peak temperature and the peak temperature times for reflow are subject to the following conditions.

- Peak Temperature - . $245^{\circ} \mathrm{C}\left(+0 /-5^{\circ} \mathrm{C}\right)$
- Peak Temperature Time within $5{ }^{\circ} \mathrm{C}\left(240^{\circ} \mathrm{C} \sim 245^{\circ} \mathrm{C}\right) \cdot$ • $20 \sim 40$ seconds

2) Touch Panel Controller KS-R8TPC or KS-R10TPC

The peak temperature and the peak temperature times for reflow are subject to the following conditions.

- Peak Temperature • . $260^{\circ} \mathrm{C}$ Max.
- Peak Temperature Time within $5{ }^{\circ} \mathrm{C}\left(255^{\circ} \mathrm{C} \sim 260^{\circ} \mathrm{C}\right)$ • • 16 seconds max.
